Project Title : CineHall - An Online Movie Ticket Booking System

2.1. Functional requirements:

1. **Browsing Movies:** Users can view all movies categorized as "Now Showing" or "Coming Soon" with details like genre, language, duration, certificate, and rating
2. **Seat Selection:** Users can view a live seat map for a selected showtime, distinguishing available, booked, and tier-priced seats.
3. **Booking Management:** Users can view their past and upcoming bookings (searchable by email) and cancel a booking before the showtime.

2.2. Non-functional requirements:

1. **Responsiveness:** The application adapts to different screen sizes, from desktop monitors down to small mobile devices, ensuring usability on any device.
2. **Usability:** The system should provide a simple, intuitive interface so that users with no technical background can browse movies, book tickets, and manage bookings without difficulty.
3. **Portability:** The application should run on any standard web browser without needing special installation or server setup.

2.3. List of AI tools used for building UI (if any):

1. Claude

2.4. Prompt (if any):

Sl. No	Name of the tool	prompts
1	Claude	Build a complete, front-end-only movie ticket booking website called "CineHall" using plain HTML, CSS, and vanilla JavaScript (no frameworks, no build step). Persist all data in localStorage so the site is fully clickable with no backend. Structure it as multiple linked HTML pages sharing one stylesheet and one shared JS data/helper file. Files to produce • styles.css — shared stylesheet • script.js — shared data layer (DB object) + helper functions • admin-shell.js — renders the admin sidebar/topbar shell and guards admin pages • index.html — movie listing homepage • login.html — customer sign in / sign up (tabs, no real validation) • movie-details.html — movie info + showtime picker • seats.html — interactive seat map + booking bar • checkout.html — checkout form • confirmation.html — ticket confirmation • my-bookings.html — customer's bookings, filterable by email, with cancel • profile.html — customer profile page • admin-login.html — admin sign in (any credentials work, it's a demo) • admin-dashboard.html — admin stats + recent bookings • admin-movies.html — CRUD for movies (modal add/edit form) • admin-shows.html — CRUD for showtimes (modal add form) • admin-bookings.html — searchable bookings table with cancel Visual design system (dark cinema-hall theme) • Google Fonts: Bebas Neue (display headings, uppercase, letter-spacing), Manrope (body, weights 400–800), JetBrains Mono (labels, codes, prices) • CSS custom properties for a dark palette: background #0b0b10, raised surfaces #111118/#15151d/#1d1d28, borders #26262f/#1c1c25, gold accent #e3b23c (dim

		#a3812f, glow rgba(227,178,60,.35)), velvet-red accent #a5294c (dim #3a1420), success green #4caf7d, text #f1efe6/#9291a0/#5f5e6c • Body background has two soft radial gradients (gold top-left, velvet top-right) over the base dark color • Pill-shaped gold buttons (.btn-gold) with glow on hover, outline/ghost/danger variants, all fully rounded (border-radius:999px) • Rounded cards (16px radius) with subtle borders, no heavy shadows except a shared --shadow-lift for modals • "Eyebrow" labels: small uppercase mono text in gold with a short leading dash line • Circular gradient "brand mark" logo (conic-gradient gold→velvet→gold with a dark center dot) next to "CineHall" in Bebas Neue • Sticky, blurred (backdrop-filter) top nav for customer pages • Fully responsive: nav collapses to a slide-down mobile menu under 760px; admin sidebar collapses to a slide-in drawer under 860px; seat grid, tables, tickets, and booking bar all have dedicated mobile breakpoints down to 380px Shared data layer (script.js → DB object) Use localStorage keys: ch_movies, ch_shows, ch_bookings, ch_session. • DB.seed() — on first load, seeds 6 demo movies (mix of now-showing/upcoming, varied genres/languages/ratings/runtimes) and auto-generates showtimes for the first 4 "now showing" movies across 2 cinemas, 2 days, 3 times/day, with silver/gold/premium pricing (150/220/320). Seeds bookings as an empty array. • CRUD helpers: getMovies/getMovie/saveMovies, getShows/getShow/saveShows/ showsForMovie, getBookings/saveBookings/addBooking/cancelBooking (cancelling a booking flips its status and releases its seats back to the show) • Session helpers: setSession/getSession/clearSession — session object has {name, email, role: 'customer' 'admin'} Helper functions: qs/qsq (querySelector shortcuts), fmtDate (readable date), genCode (ticket code like "CH-XXXX-1234"), toast (bottom-right slide-in notification), getParam (URL query param reader), requireAuth (redirects to login if no customer session, remembering the return URL in sessionStorage), initNavToggle / initSidebarToggle (mobile menu toggles). Also include buildSeatMap(container, show, opts): generates an 8-row (A–H) × 10-seat map, rows A–B = premium tier, C–E = gold, F–H = silver, marks already- booked seats as disabled, toggles selection
--	--	---

on click up to a max (default 8, toasts a warning if exceeded), and returns {getSelected(), totalPrice()}.

Page-by-page behavior

index.html — Hero header, horizontally-scrolling "Now Showing" poster row, grid of "Coming Soon" posters. Poster art is a colored gradient block (color keyed by genre) with a star rating badge and the movie's initials, since there are no real images. Nav shows Sign In or the logged-in user's name + Logout depending on session. "My Bookings" nav link prompts sign-in if not logged in. Includes a small "Admin →" link in the nav.

login.html — Tabbed Sign In / Create Account forms. No real auth — submitting either form just stores a customer session (name from the form, or derived from the email prefix for sign-in) and redirects to wherever the user was trying to go before (or profile.html by default).

movie-details.html — Poster block + title/meta/synopsis. If upcoming, shows a "booking opens soon" message. If now showing, shows date chips (from that movie's available show dates) and, per selected date, cards grouped by cinema listing time chips linking to seats.html?showId=...

seats.html — Requires auth. Renders the seat map with a curved "Screen" arc above it and a legend below. A fixed bottom booking bar shows seat count, selected seat list, running total price, and a Confirm button (disabled until ≥ 1 seat selected) that stores the pending booking in sessionStorage and goes to checkout.

checkout.html — Requires auth (via the pending-booking check). Shows an order summary card, then a form (name/email/phone, prefilled from session) that on submit creates a booking object (unique id, generated ticket code, status "confirmed", ISO timestamp), saves it via DB.addBooking, stores it as "last booking," and redirects to confirmation.

confirmation.html — Renders a stylized ticket: cinema/movie/date/time/seats on top, a dashed divider, ticket code + name + total on the bottom left, and a decorative QR placeholder box on the right. Buttons to view bookings or book another movie.

my-bookings.html — Email-filterable list of bookings (defaults to the logged-in user's email). Each booking is a card with movie/show/seats info, a status badge, the ticket code, and a Cancel button — disabled if already cancelled or if the showtime has already passed.

profile.html — Requires a customer session. Shows an avatar circle with initials, name, email, account type, and buttons to view bookings or log out.

		Admin pages — All admin pages except admin-login.html call <code>renderAdminShell()</code> from <code>admin-shell.js</code> first; if there's no admin session it redirects to admin-login.html and returns null, and the page's script guards all further work behind <code>if(ui){ ... }</code>. The shell renders a sidebar (Dashboard/Movies/Showtimes links, active one highlighted, logout at bottom) and a topbar with a page title and an optional right-side slot for page-specific controls (search box, "+ Add" buttons). • admin-login.html: demo login, any username/password creates an admin session. • admin-dashboard.html: 4 stat cards (movies listed, active showtimes, tickets booked, revenue + seats sold) and a table of the 8 most recent bookings. • admin-movies.html: table of all movies with edit/delete icon buttons; a modal form (title, genre, language, duration, certificate U/UA/A, status now/upcoming, synopsis) handles both add and edit, writing back to DB. • admin-shows.html: table of showtimes with a delete button; a modal form to add a new showtime (movie dropdown, cinema, date, time, three tier prices). • admin-bookings.html: searchable (by name/email/code) table of all bookings with a cancel button per row. All destructive actions (delete movie, remove showtime, cancel booking) use a native <code>confirm()</code> dialog and a toast on success. Tone / scope notes • This is a DBMS/portfolio demo, not a production system — no real payment processing, no server, no password hashing; note that clearly if asked. • Keep the code organized exactly as above (one shared <code>script.js</code> data layer, one <code>admin-shell.js</code>, one stylesheet, and one HTML file per page) so it stays easy to extend later (e.g. swapping <code>localStorage</code> for real API calls).
